

# Introduction to Git and GitHub

# Overview

1. Install git and create a GitHub account
2. What is git?
3. How does git work?
4. What is GitHub?
5. Quick example using git and GitHub

# 1 Install git and create a GitHub account

# Install Git

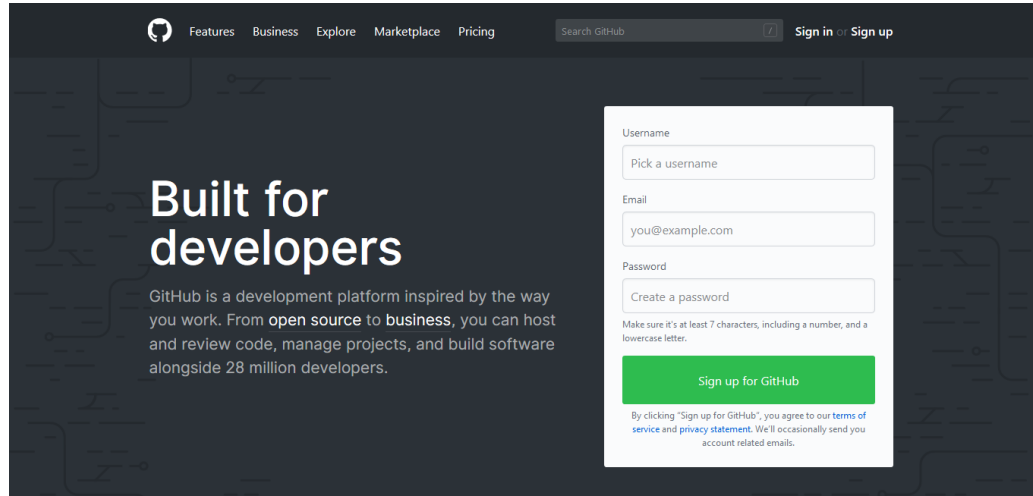

- **Linux (Debian)**
  - Command: `sudo apt-get install git`
- **Linux (Fedora)**
  - Command: `sudo yum install git`
- **Mac**
  - <http://git-scm.com/download/mac>
- **Windows**
  - <http://git-scm.com/download/win>

# Create GitHub account

- [www.github.com](https://www.github.com)
- Free for public repositories

The image shows the GitHub sign-up page. The background is dark with a faint circuit pattern. On the left, the text "Built for developers" is prominent, followed by a paragraph about GitHub being a development platform for open source and business. On the right, there is a white sign-up form with fields for Username, Email, and Password. Below the form is a green "Sign up for GitHub" button. At the bottom, there is a small disclaimer about terms of service and privacy statement.

## Built for developers

GitHub is a development platform inspired by the way you work. From **open source** to **business**, you can host and review code, manage projects, and build software alongside 28 million developers.

Make sure it's at least 7 characters, including a number, and a lowercase letter.

Sign up for GitHub

By clicking "Sign up for GitHub", you agree to our [terms of service](#) and [privacy statement](#). We'll occasionally send you account related emails.

# What is version control?

- A system that keeps records of your changes
- Allows for collaborative development
- Allows you to know who made what changes and when
- Allows you to revert any changes and go back to a previous state

What is git?

# What is git?

- Distributed version control
- Users keep entire code and history on their local machines
- Users can make any changes without internet access
- (Except pushing and pulling changes from a remote server)

# What is git?

- Started in 2005
- Created by Linus Torvalds to aid in Linux kernel development

# What is git?

- Git isn't the only version control system

- But (we think) it's the best

How does git work?

# How does git work?

- Can be complicated at first, but there are a few key concepts
- Important git terminology in following slides are **blue**

## Key Concepts: *Snapshots*

- The way git keeps track of your code history
- Essentially records what all your files look like at a given point in time
- You decide when to take a snapshot, and of what files
- Have the ability to go back to visit any snapshot
- Your snapshots from later on will stay around, too

## Key Concepts: *Commit*

- The act of creating a snapshot
- Can be a noun or verb
  - “I committed code”
  - “I just made a new commit”
- Essentially, a project is made up of a bunch of commits

# Key Concepts: *Commit*

*Commits contain three pieces of information:*

1. Information about how the files changed from previously
2. A reference to the commit that came before it  
Called the “**parent commit**”
3. A **hash code** name  
Will look something like:  
fb2d2ec5069fc6776c80b3ad6b7cbde3cad  
e4e

## Key Concepts: *Repositories*

- Often shortened to ‘[repo](#)’
- A collection of all the files and the history of those files
- Consists of all your commits
- Place where all your hard work is stored

## Key Concepts: *Repositories*

- Can live on a local machine or on a remote server (GitHub!)
- The act of copying a repository from a remote server is called **cloning**
- Cloning from a remote server allows teams to work together

## Key Concepts: *Repositories*

- The process of downloading commits that don't exist on your machine from a remote repository is called **pulling** changes
- The process of adding your local changes to the remote repository is called **pushing** changes

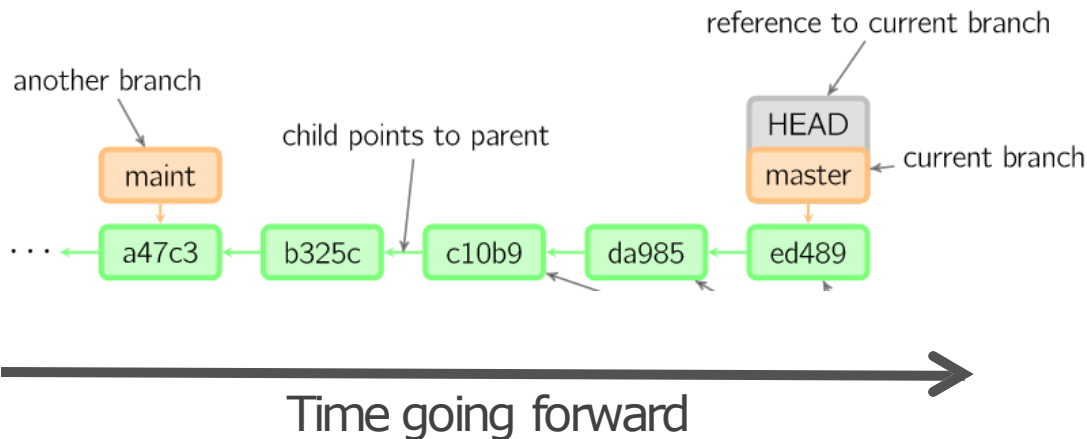

## Key Concepts: *Branches*

- All commits in git live on some branch
- But there can be many, many branches
- The main branch in a project is called the 'master' branch

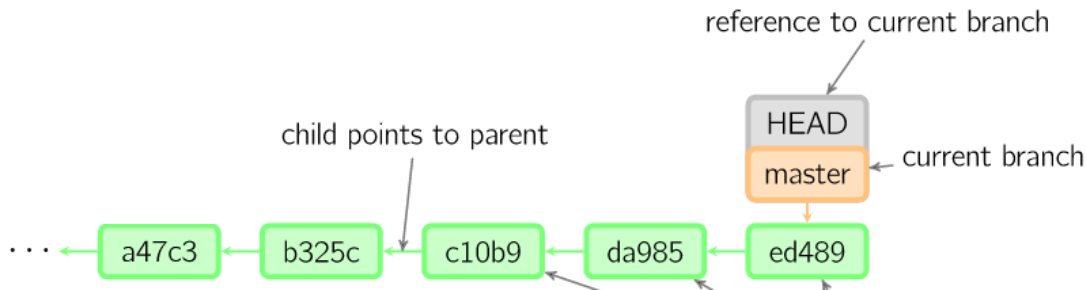

# So, what does a typical project look like?

- A bunch of commits linked together that live on some branch, contained in a repository

# So, what is *HEAD*?

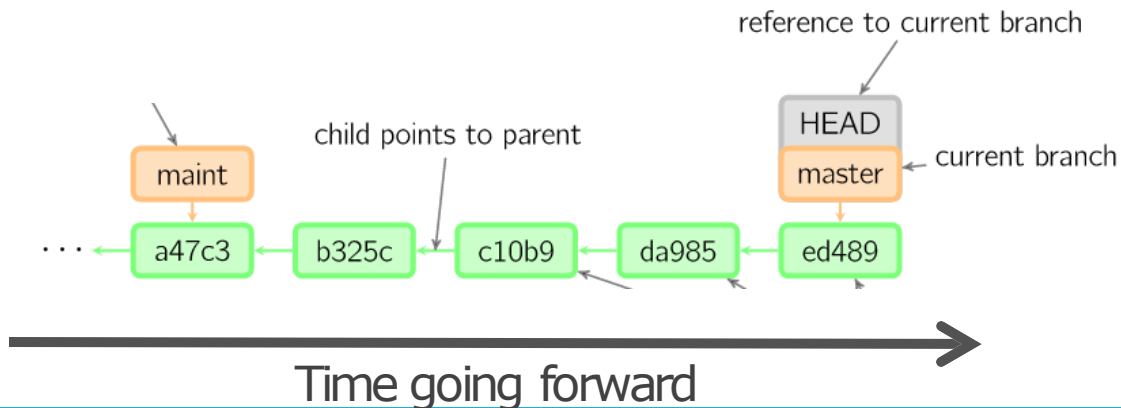

- A reference to the most recent commit

# So, what is *MASTER*?

- The main branch in your project
- Doesn't have to be called master, but almost always is!

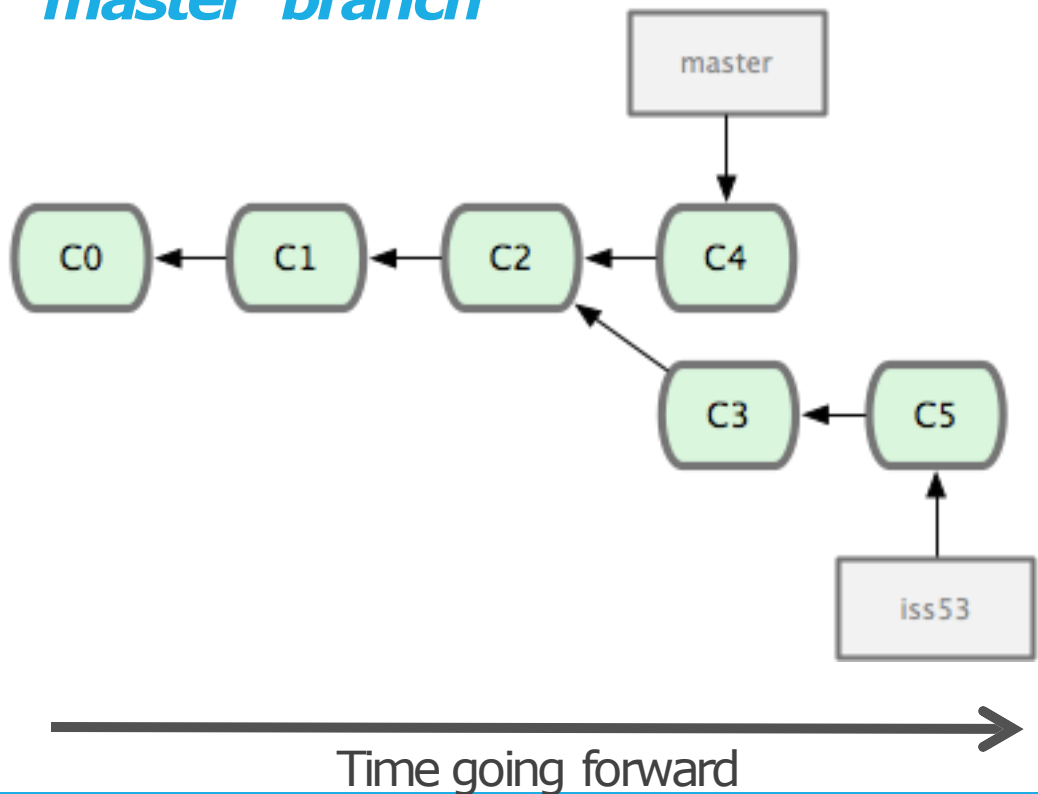

## Key Concepts: *Branching off of the master branch*

- The start of a branch points to a specific commit
- When you want to make any changes to your project you make a new branch based on a commit

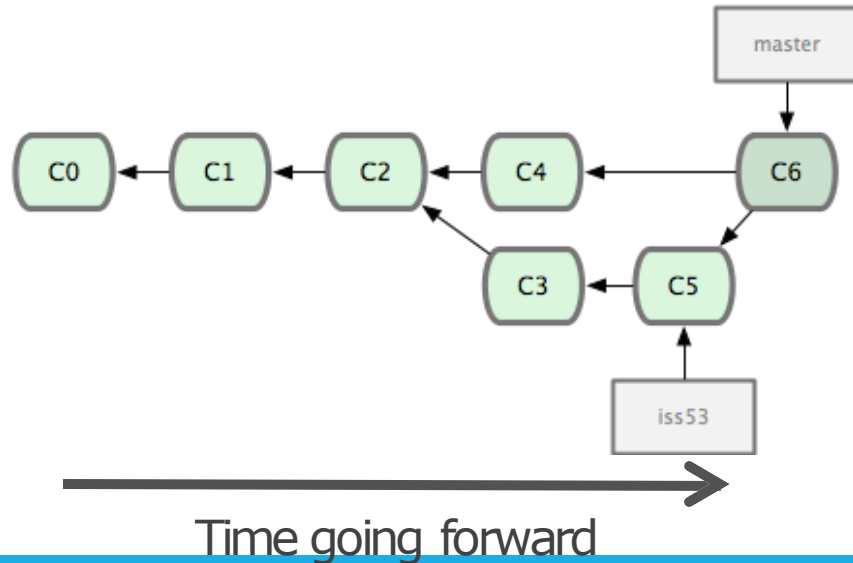

## Key Concepts: *Branching off of the master branch*

# Key Concepts: *Merging*

- Once you're done with your feature, you **merge** it back into master

## Key Concepts: *How do you make a commit anyway?*

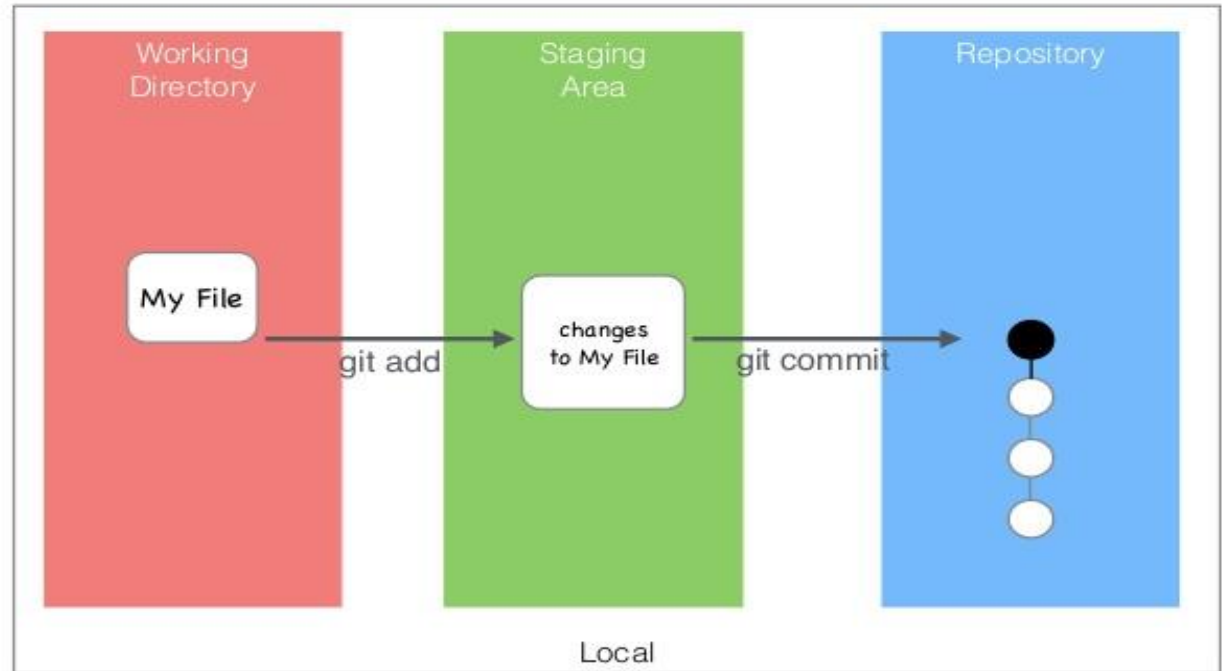

- There are a lot of ‘states’ and ‘places’ a file can be
- Local on your computer: the ‘**working directory**’
- When a file is ready to be put in a commit you add it onto the ‘**index**’ or ‘**staging area**’

## Key Concepts: *How do you make a commit anyway?*

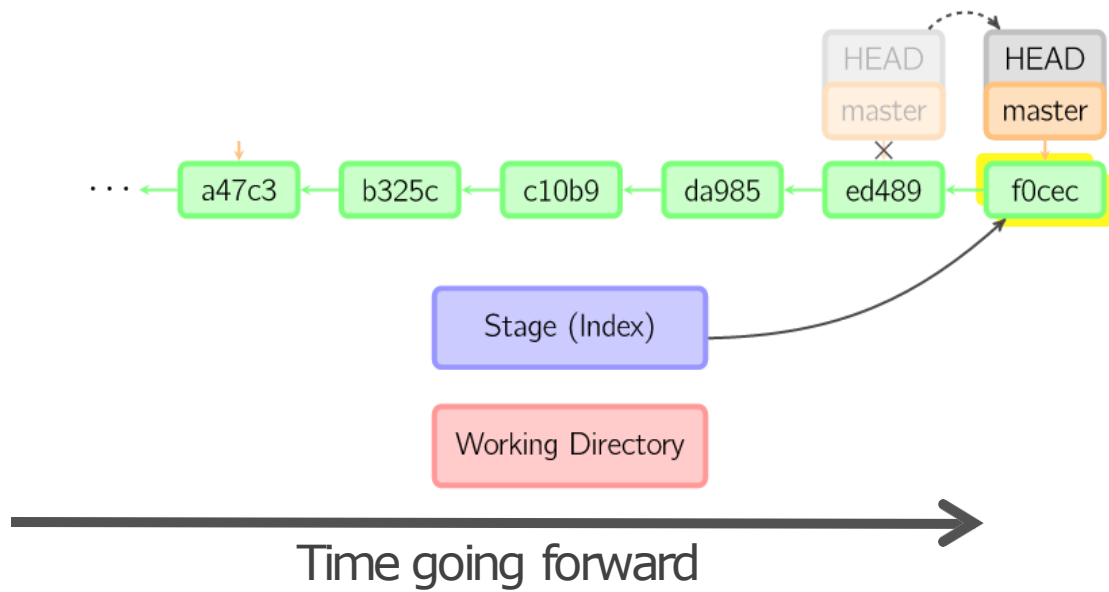

- The process:
  - Make some changes to a file
  - Use the ‘git add’ command to put the file onto the staging environment
  - Use the ‘git commit’ command to create a new commit’

What is GitHub?

# What is GitHub?

Octocat!

- Founded in 2008
- [www.github.com](https://www.github.com)
- Largest web-based git repository hosting service
- Aka, hosts ‘remote repositories’
- Allows for code collaboration with anyone online

# What is GitHub?

- Adds extra functionality on top of git
- UI, documentation, bug tracking, feature requests, pull requests, and more!
- Has a student developer pack for university students
